Fundamentals of Data

Structure

Lecture #2

Fundamental data structures

- list
 - array
 - linked list
 - string
- stack
- queue
- priority queue/heap
- graph
- tree and binary tree
- set and dictionary

□ Arrays

- A sequence of n items of the same data type that are stored contiguously in computer memory and made accessible by specifying a value of the array's index.

□ Linked List

- A sequence of zero or more nodes each containing two kinds of information: some data and one or more links called pointers to other nodes of the linked list.
- Singly linked list (next pointer)
- Doubly linked list (next + previous pointers)

■ Arrays

- fixed length (need preliminary reservation of memory)
- contiguous memory locations
- direct access
- Insert/delete

■ Linked Lists

- dynamic length
- arbitrary memory locations
- access by following links
- Insert/delete

□ Stacks

- A stack of plates
 - insertion/deletion can be done only at the top.
 - LIFO
- Two operations (push and pop)

□ Queues

- A queue of customers waiting for services
 - Insertion/enqueue from the rear and deletion/dequeue from the front.
 - FIFO
- Two operations (enqueue and dequeue)

- Priority queues (implemented using heaps)
 - A data structure for maintaining a set of elements, each associated with a key/priority, with the following operations
 - Finding the element with the highest priority
 - Deleting the element with the highest priority
 - Inserting a new element
 - Scheduling jobs on a shared computer

□ Formal definition

- A graph $G = \langle V, E \rangle$ is defined by a pair of two sets: a finite set V of items called **vertices** and a set E of vertex pairs called **edges**.

□ **Undirected** and **directed** graphs (**digraphs**).

□ What's the maximum number of edges in an undirected graph with $|V|$ vertices?

□ **Complete, dense, and sparse** graphs

- A graph with every pair of its vertices connected by an edge is called complete, $K_{|V|}$

- Adjacency matrix
 - $n \times n$ boolean matrix if $|V|$ is n .
 - The element on the i th row and j th column is 1 if there's an edge from i th vertex to the j th vertex; otherwise 0.
 - The adjacency matrix of an undirected graph is symmetric.
- Adjacency linked lists
 - A collection of linked lists, one for each vertex, that contain all the vertices adjacent to the list's vertex.
- Which data structure would you use if the graph is a 100-node star shape?

```
0 1 1 1
0 0 0 1
0 0 0 1
0 0 0 0
```

Weighted Graphs

□ Weighted graphs

- Graphs or digraphs with numbers assigned to the edges.

□ Paths

- A path from vertex u to v of a graph G is defined as a sequence of adjacent (connected by an edge) vertices that starts with u and ends with v .
- **Simple paths:** All edges of a path are distinct.
- Path lengths: the number of edges, or the number of vertices $- 1$.

□ Connected graphs

- A graph is said to be connected if for every pair of its vertices u and v there is a path from u to v .

□ Connected component

- The maximum connected subgraph of a given graph.

□ Cycle

- A simple path of a positive length that starts and ends at the same vertex.

□ Acyclic graph

- A graph without cycles
- **DAG** (Directed Acyclic Graph)

□ Trees

- A tree (or **free tree**) is a connected acyclic graph.
- Forest: a graph that has no cycles but is not necessarily connected.

□ Properties of trees

- For every two vertices in a tree there always exists exactly one simple path from one of these vertices to the other. **Why?**
 - **Rooted trees:** The above property makes it possible to select an arbitrary vertex in a free tree and consider it as the root of the so called rooted tree.
 - Levels in a rooted tree.

Rooted Trees (I)

□ Ancestors

- For any vertex v in a tree T , all the vertices on the simple path from the root to that vertex are called ancestors.

□ Descendants

- All the vertices for which a vertex v is an ancestor are said to be descendants of v .

□ Parent, child and siblings

- If (u, v) is the last edge of the simple path from the root to vertex v , u is said to be the parent of v and v is called a child of u .
- Vertices that have the same parent are called siblings.

□ Leaves

- A vertex without children is called a leaf.

□ Subtree

- A vertex v with all its descendants is called the subtree of T rooted at v .

Rooted Trees (II)

□ Depth of a vertex

- The length of the simple path from the root to the vertex.

□ Height of a tree

- The length of the longest simple path from the root to a leaf.

- Ordered trees
 - An ordered tree is a rooted tree in which all the children of each vertex are ordered.
- Binary trees
 - A binary tree is an ordered tree in which every vertex has no more than two children and each children is designated as either a left child or a right child of its parent.
- Binary search trees
 - Each vertex is assigned a number.
 - A number assigned to each parental vertex is larger than all the numbers in its left subtree and smaller than all the numbers in its right subtree.
- $\lfloor \log_2 n \rfloor \leq h \leq n - 1$, where h is the height of a binary tree and n the size.

Thank You !!!
